S75330
hypothetical protein sll1570 - Synechocystis sp. (strain PCC 6803)
C; Species: Synechocystis sp.
A; Variety: PCC 6803
C; Date: 25-Apr-1997 #sequence_revision 25-Apr-1997 #text_change 20-Ju C; Accession: S75330
R; Kaneko, T.; Sato, S.; Kotani, H.; Tanaka, A.; Asamizu, E.; Nakamurë o, K.; Okumura, S.; Shimpo, S.; Takeuchi, C.; Wada, T.; Watanabe, A.; DNA Res. 3, 109-136, 1996
A; Title: Sequence analysis of the genome of the unicellular cyanobact S.
A; Reference number: S74322; MUID:97061201
A; Accession: S75330
A; Status: nucleic acid sequence not shown; translation not shown A; Molecule type: DNA
A; Status: nucleic acid sequence not shown; translation not shown A; Molecule type: DNA
A; Status: nucleotide sequence was submitted to the EMBL Data Librar C; Genetics:
A; Start codon: GTG
C; Superfamily: Synechocystis hypothetical protein sll1570
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;

THE A CHAIN IS RESPONSIBLE FOR DNA BREAKAGE AND REJOINING; THE B CHAIN CATALYZES ATP HYDROLYSIS. THE ENZYME FORMS AN A2B2 TETRAMER.
                                                                                                                                                                                                                                                                                                                                                                                                                               Gene 161:11-14(1995).

Gene 161:11-14(1995).

-!- FUNCTION: DNA GYRASE NEGATIVELY SUPERCOILS CLOSED CIRCULAR DOUBLE-STRANDED DNA IN AN ATP-DEPENDENT MANNER AND ALSO CATALYZES THE INTERCONVERSION OF OTHER TOPOLOGICAL ISOMERS OF DOUBLE-STRANDED DNA INCLUDING CATENANES AND KNOTTED RINGS.

-!- CATALYTIC ACTIVITY: ATP-DEPENDENT BREAKAGE, PASSAGE AND REJOINING OF DOUBLE-STRANDED DNA.
                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

"Aromatic amino acid biosynthesis in Buchnera aphidicola (endosymbiont of aphids): cloning and sequencing of a DNA fragment containing aroH-thrS-infC-rpmI-rplT.";

Curr. Microbiol. 30:313-316(1995).

-!- FUNCTION: IF-3 BINDS TO THE 30S RIBOSOMAL SUBUNIT AND SHIFTS THE EQUILIBRUM BETWEEN 70S RIBOSOMES AND THEIR 50S AND 30S SUBUNITS IN FAVOR OF THE FREE SUBUNITS, THUS ENHANCING THE AVAILABILITY OF 30S SUBUNITS ON WHICH PROTEIN SYNTHESIS INITIATION BEGINS.

-!- SUBUNIT: MONOMER (BY SIMILARITY).

-!- SUBCELLULAR LOCATION: CYTOPLASMIC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 restrictions on

Bishai W.;
"Whole genome comparison of Mycobacterium tuberculosis clinical and laboratory strains.";
Submitted (APR-2001) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: DNA N-GLYCOSYLASE WITH AN AP LYASE ACTIVITY. REQUIRED FOR THE REPAIR OF OXIDATIVE DNA DAMAGE (BY SIMILARITY).
-!- SIMILARITY: BELONGS TO THE FPG FAMILY.

Submitted (JAN-1998) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: CONVERTS INTERNALIZED GLUTAMATE TO GABA AND INCREASES

THE INTERNAL PH. INVOLVED IN GLUTAMATE-DEPENDENT ACID RESISTANCE.

-!- CATALYTIC ACTIVITY: L-GLUTAMATE = 4-AMINOBUTANOATE + CO(2).

-!- COFACTOR: PYRIDOXAL PHOSPHATE (BY SIMILARITY).

-!- INDUCTION: EXPRESSION IS HIGHEST AT ONSET OF STATIONARY PHASE IN PRESENCE OF NACL AND GLUTAMATE, AND AT LOW PH. CHLORIDE-DEPENDENT EXPRESSION IS ACTIVATED BY GADR.

-!- SIMILARITY: BELONGS TO GROUP II DECARBOXYLASES (DDC, GAD, HDC AND

```
thermostable alpha-galactosidase of Thermococcus alcaliphilus

AEDI112RA, a bacterium that shows optimum growth at 85 deg c and
pH 9.5. Also claimed are: (1) an isolated polynucleotide (see
AAT93753) encoding the alpha-galactosidase; (2) a vector containing
the polynucleotide or homologous or complementary sequences; (2)
host cells containing the vector; (3) a process for producing the
alpha-galactosidase in transformed or transfected host cells; an
enzyme showing at least 70% identity to alpha-galactosidase and
comprising at least 70% identity to alpha-galactosidase and
comprising at least 30 amino acid residues of its sequence; and (4)
a method for hydrolysing alpha-galactoside bonds using the enzyme.
The enzyme can be used to hydrolyse raffinose to sucrose and glucose
in sugar beet processing (raffinose inhibits crystallisation of
sucrose), and as a digestive aid to hydrolyse raffinose, stachyose
and verbascose in beans and other gassy foods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      171
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       285

The enzyme can be used for efficient industrial liquefaction of glucopolymers at high temperatures.

                                                                                                                                                                                                                                                                         The super heat-resistant 4-alpha-glucanotransferase has an optimum pH of 6.0-8.0, with an optimum temperature at pH 7.5 of 100 deg. C. It has at least 90% activity after heat-treatment at 100 deg. C for 30 minutes at pH 7.5. It can transfer at least one glucose unit in alpha-1,4-glucan to alpha-1,4-glucan by an alpha-1,4-glucoside bond.

AAH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis. (II) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the S. epidermidis polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides may also be used to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH55090 represent specifically claimed S. epidermidis genomic DNA colymcleotide sequences from the present invention. AAH55091 to AAH55090 represent oligonucleotide sequences and primers which are used in the exemplification of the present invention.

N.B. The present invention specifically claims all the polynucleotide sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4465 to 4472, no sequences are present for SEQ ID NO:4455 to 4464.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        271
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  171
                                                                                                                                                                                                                                                                                                                                            Nucleic acids encoding polypeptides from Staphylococcus epidermidis useful for vaccinating against infections, e.g. endocarditis -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis. (II) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the S. epidermidis polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of the activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH55090 represent specifically claimed S. epidermidis genomic DNA polynucleotide sequences from the present invention. AAH55091 to AAH55098 represent oligonucleotide sequences and primers which are used in the avammalification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                can be used

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          in the exemplification of the present invention.

N.B. The present invention specifically claims all the polynucleotide sequences given in the sequence listing of the present specification, however the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4465 to 447 no sequences are present for SEQ ID NO:4465 to 447
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          acids encoding polypeptides from Staphylococcus epidermidis
or vaccinating against infections, e.g. endocarditis -

AAY36754-Y37949 are encoded by open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). The polypeptides can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as

                                                                                                                                                                                                                                                                                                       The present sequence is that of UDP glucose synthase from cotton. E.coli host cells transformed with a plasmid carrying cDNA coding for this enzyme had UDP glucose synthetic activity of 150 U and UDP glucose decomposition activity of 130 U; this compares with values of 0 and 0.027, respectively for E.coli transformed with a plasmid not carrying the UDP glucose synthase gene.
                                                                                                                                                                                    gootton UDP glucose synthase - also vectors contg. the DNA, useful for prodn. of stable

                                                                                                                                                                                                            The present sequence represnets a plant uridine diphosphate (UDP) gphosphorylase. The polynucleotides may be used to create transgenic plants which express the UDP glucose phosphorylase at higher or low levels than normal or in cell types or developmental stages in which they are not normally found. This would alter the level of cell wal and starch biosynthesis in those cells. The polynucleotides may also be used as probes for genetically and physically mapping the genes that they are a part of, and as markers for traits linked to those
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     nthesis
                                                                                                                    New polynucleotides encoding uridine diphosphate (UDP) glucose phosphorylase in plants and seeds, useful for creating transgenic plants which express UDP glucose phosphorylase at higher or lower levels than normal -

                                                                                                                                                                                                                                                                      The present sequence represents a plant uridine diphosphate (UDP) glucphosphorylase. The polynucleotides may be used to create transgenic plants which express the UDP glucose phosphorylase at higher or lower levels than normal or in cell types or developmental stages in which they are not normally found. This would alter the level of cell wall and starch biosynthesis in those cells. The polynucleotides may also be used as probes for genetically and physically mapping the genes that they are a part of, and as markers for traits linked to those
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   102 pksvievrngftfldlivigieslnkkygcsvplllmnsfnthddtgklvekysnsniei 161

                                                                                                                                                                                                                                                          The present sequence is a bait polypeptide used in a Helicobacter pylori two-hybrid screen to identify protein-protein interactions. The method is used to identify a recombinant cell clone expressing a prey polypeptide which is capable of interacting with the bait polypeptide. The two hybrid system is useful for screening compounds for antibacterial activity. It may be used in the treatment of gastric ulcers. The polynucleotides are useful as amplification primers or specific detection probes. The polypeptides, vectors or host cells can be used as immunogens to produce mono- or polyclonal antibodies. The polynucleotides, polypeptides, antibodies, vectors, host cells or modulating agents can be used to produce a pharmaceutical composition.
                                                                                                                                                              the treatment
